

CCDC Inject

INJECT NAME	35 Assess and harden host-based firewall configuration
INJECT ID	FW01

INJECT DESCRIPTION:

We need to validate whether our hosts are exposing more network services than required. Following recent scanning activity, it's essential that each system's host-based firewall is enabled and restricts inbound access to only the ports necessary for its role.

Provide the output showing your current firewall rules (e.g. "ufw status verbose" or "iptables -L -n -v") and your plan to restrict inbound access to only the required services on each host.
