

CCDC Inject

INJECT NAME	36 Configure brute-force protection for remote login services
INJECT ID	FAIL2BAN01

INJECT DESCRIPTION:

We have seen repeated failed login attempts against several of our systems. It's essential that we automatically detect and block hosts that are attempting to brute-force their way into our services.

Provide the output showing whether a brute-force protection tool (such as Fail2Ban) is installed and active (e.g. "fail2ban-client status"), and your plan to install, configure, and enable it to protect remote login services if it is not already doing so.
