

CCDC Inject

INJECT NAME	42 Assess and harden the PAN-OS security policy rulebase
INJECT ID	PANOS01

INJECT DESCRIPTION:

We are concerned that the security policy rulebase on the PAN-OS firewall may contain broad, port-based "any/any" style allow rules, that logging may not be enabled on every rule, and that App-ID is not being used to enforce least privilege between zones.

Provide the output of your current security policy rulebase (e.g. via the CLI with "show running security-policy" or the Policies > Security tab in the web UI) and your plan to tighten these rules if necessary — converting port-based rules to App-ID based rules, removing or restricting unnecessary "any" rules, and ensuring logging is enabled on every rule.
