

CCDC Inject

INJECT NAME	45 Assess and harden exposed network services
INJECT ID	SVC01

INJECT DESCRIPTION:

We need to validate which network services are listening on each Linux host and confirm that no unnecessary or unauthorized services are exposed.

Provide the output from "ss -tulpn" (or "netstat -tulpn") and "systemctl list-units --type=service --state=running" and your plan to disable or restrict any services that are not required for the host's role.
